

DNS Services: What is dynamic DNS and how to setup it up?

A. Dynamic IP addresses are ones that are assigned to you when you log on to the Internet. The IP address that you use may change each time you log on. Most dialup Internet accounts use dynamic IP addressing. Most cable/DSL services use dynamic IP addressing as well, however, it may not change often. Because the IP keep changes, it is difficult to link a domain name to your changing IP. Our Dynamic DNS Service enable you to run your domain over a changing IP. [Click here](#) to know how to set it up. You may need [dynamic IP update client](#) to update your changed IP to our system.
