DNS Services: How can I know my DNS Settings on DNSExit.com is working?

A. On Windows 2000/XP/NT, Linux, Unix, use command ***nslookup***

- Make sure your domain whois data is pointing to our DNS servers by using command **nslookup -type=NS yourdomainname.com** If the response does not contain all of the dnsExit name servers, then you should contact your registrar and have them change it.
- Before the domain DNS servers pointed to our name servers, you can force nslookup to user our name server by: **nslookup www.yourdomainname.com ns1.dnsexit.com**
- To look for a certain record type, like the MX record or the SOA record, you can use the parameter -type=MX or -type=SOA **nslookup -type=MX yourdomainname.com**
