

Host Your Own Email Server: Having signed up for Mail Hosting,  
how to I add the DKIM functionality?

In your FAQ, you describe how to add DKIM functionality, by additionally subscribing to your Mail Relay Outbound Service using "Sender Domains".

-> Can I use Sender Domains directly from the Mail Hosting control panel or otherwise?

-> If I sign up for Mail Relay (which I do not need) and enable DKIM, will DKIM also work for the mails I send from the Mail Hosting system - i.e. with emails NOT relayed?

?
