

Host Your Own Web Site: How can I host multiple web sites on one IP Address?

A. Most web servers, such as IIS and Apache, support Name-based Virtual Hosting that allows multiple domains(websites) to run on the same web server. For the domains to run on the same web server, while setup DNS, you should setup the domains to point to the same IP address as the web server. The following links contains instructions to setup name-based virtual hosting on IIS and Apache:

- Apache: [Name-based Virtual Host Support](#)
- Microsoft IIS: [Using Host Header Names in IIS](#)

Unique solution ID: #1051
